

A man in a dark life vest and jacket is on the deck of a boat, looking towards the camera. The background shows a vast ocean under a cloudy, overcast sky. A white cylindrical object is suspended from the boat's rigging in the upper right corner. A coiled red and white rope is visible in the lower center.

# Weather and Electronic Charts

Scott Dynes  
Sandy Wells

MIT Bluewater Sailors

# Aim of this session

Over the next two hours I hope to give you an overview of two seemingly disparate areas, weather and electronic chart plotting. At the end I hope you understand why you really need to talk about the weather at sea and electronic chart plotting together.

## Goals:

- Understand the forces that give rise to the weather
- Know the clouds associated with approaching fronts
- Where to find a range of weather forecast products
- Have a working understanding of OpenCPN, an open source ECDIS (Electronic Chart Display and Information System)
- Understand how to import and visualize weather and current grids
- Understand how to create optimal routes in OpenCPN

Of necessity we will not go into any topic in detail; there are plenty of sites on the web for further exploration.

# Agenda

## • Weather Basics

- Where does the weather come from?
- Fronts and air masses
- Cloud types
- Wind, waves, and warnings
- What can you tell from looking at the skies and barometer?
- Wave heights (wind and fetches)

## • Forecasting products

- The wide range and uses of forecasting products
- Gribs (General Regularly-distributed Information in Binary form)

## • Planning a Daysail

- A few days out - Windy, PredictWind, etc.
- A few hours out - your local weather radar, forecast and lightning
- During the sail: lightning and eyes

## • Planning a Passage (e.g. Bermuda)

- Intro to OpenCPN
- Loading and updating charts
- Requesting and importing Gribs
- Using the routing plugin with weather and current forecasts

# The Causes of Weather

- Density
- Coriolis Force
- Atmospheric pressure
- The global wind pattern
- Wind and weather
- Air masses
- Atmospheric pressure
- Isobars
- Dew point (determines bottom of cloud formations, fog, and rain)

# The Causes of Weather

Weather is caused by the interactions of air masses that are not in equilibrium – different pressures, temperatures, and moisture content.

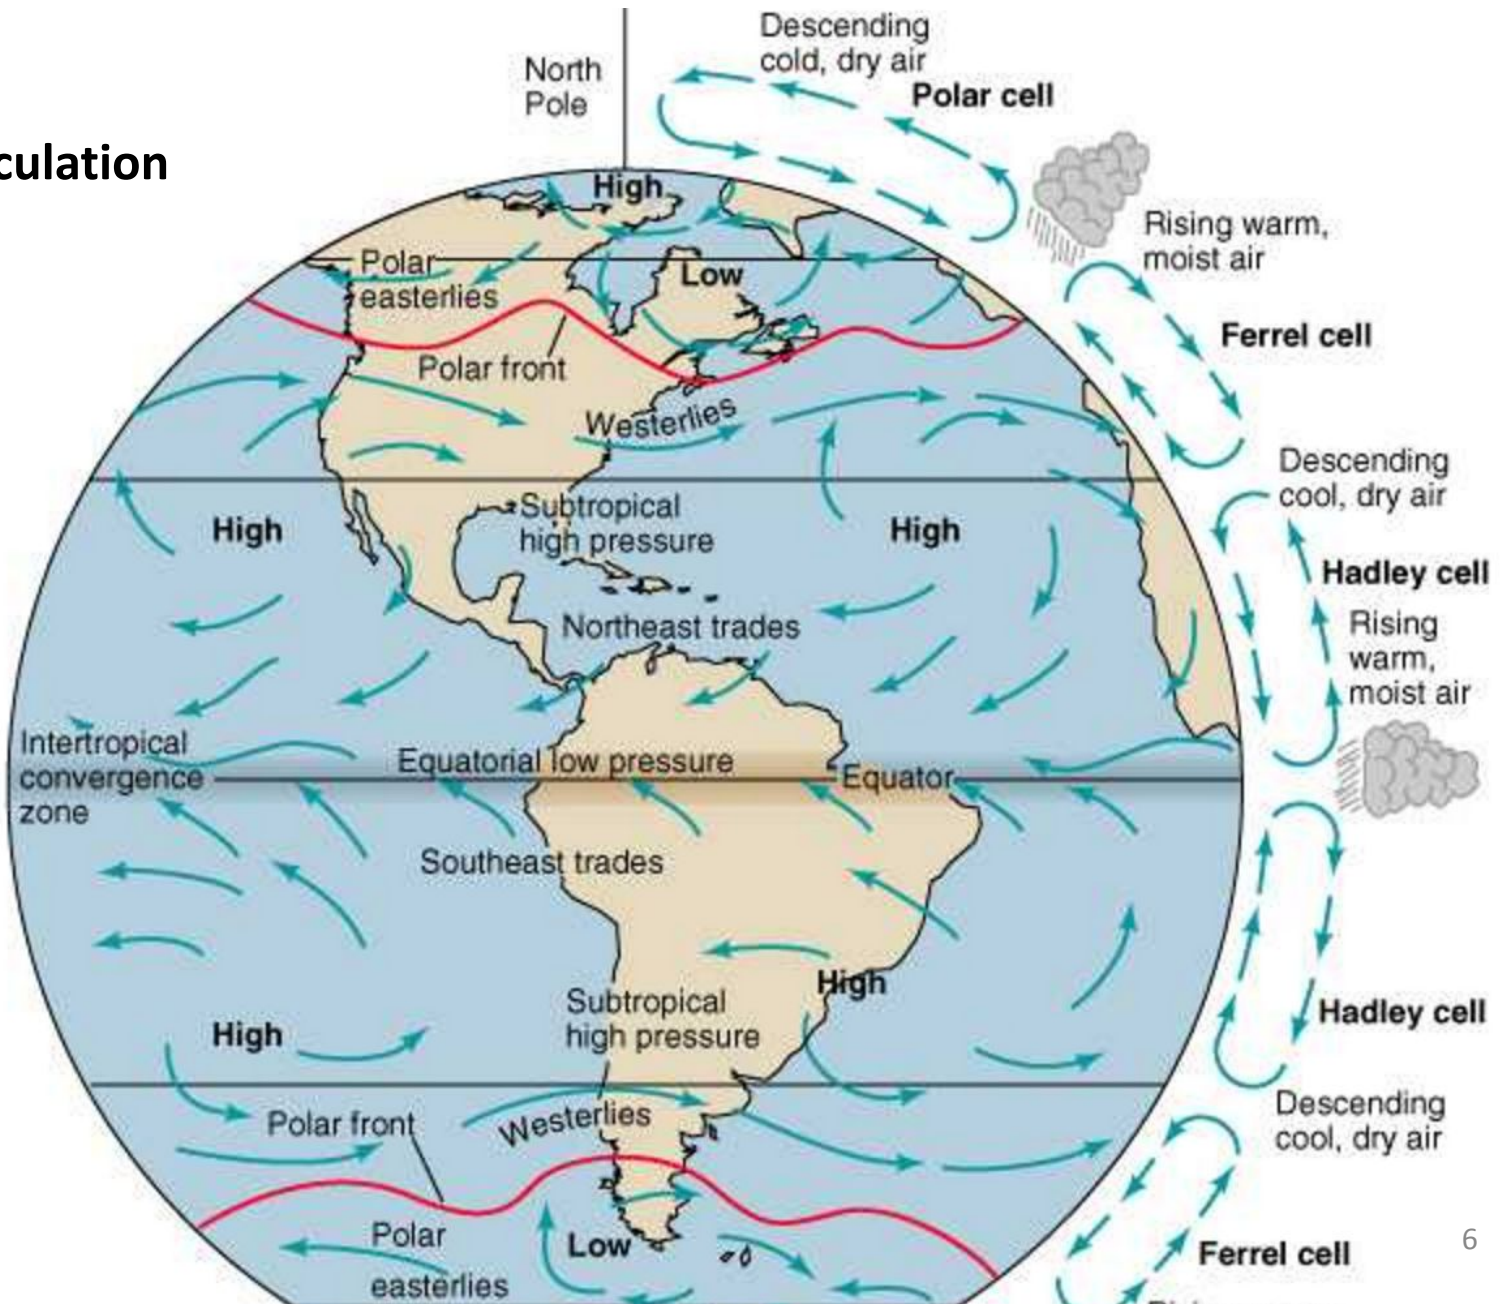

Air masses are vast expanses of air that have similar densities, temperatures and moisture and arise from different geographical regions; they move as part of the prevailing winds.

When two dissimilar air masses meet, their boundary is a ‘front’, which is what gives rise to much of the interesting weather.

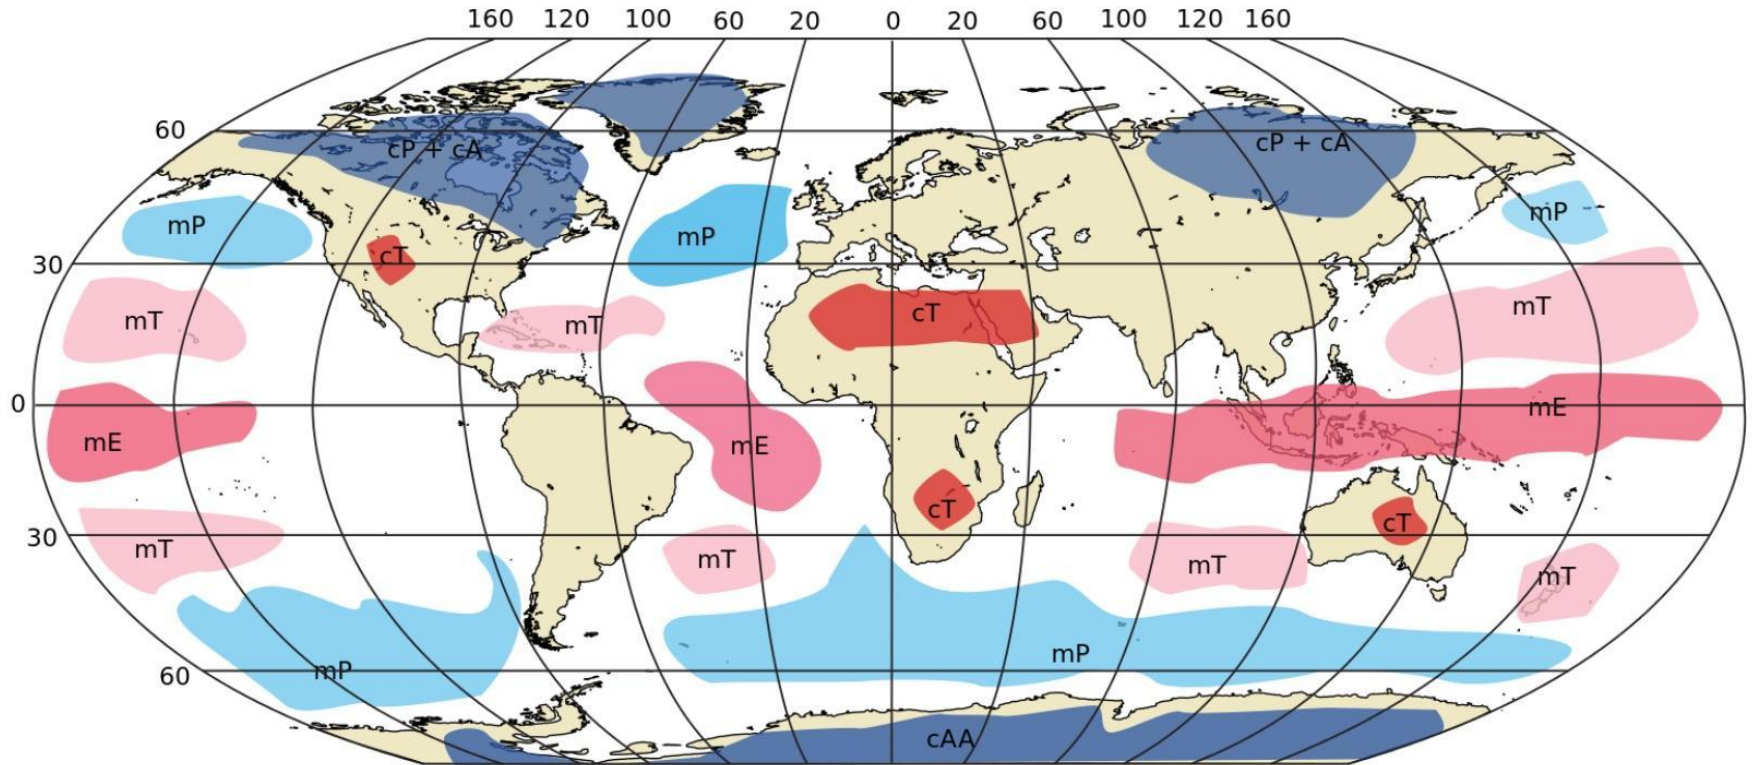

# The Causes of Weather

## Global Circulation

# The Causes of Weather

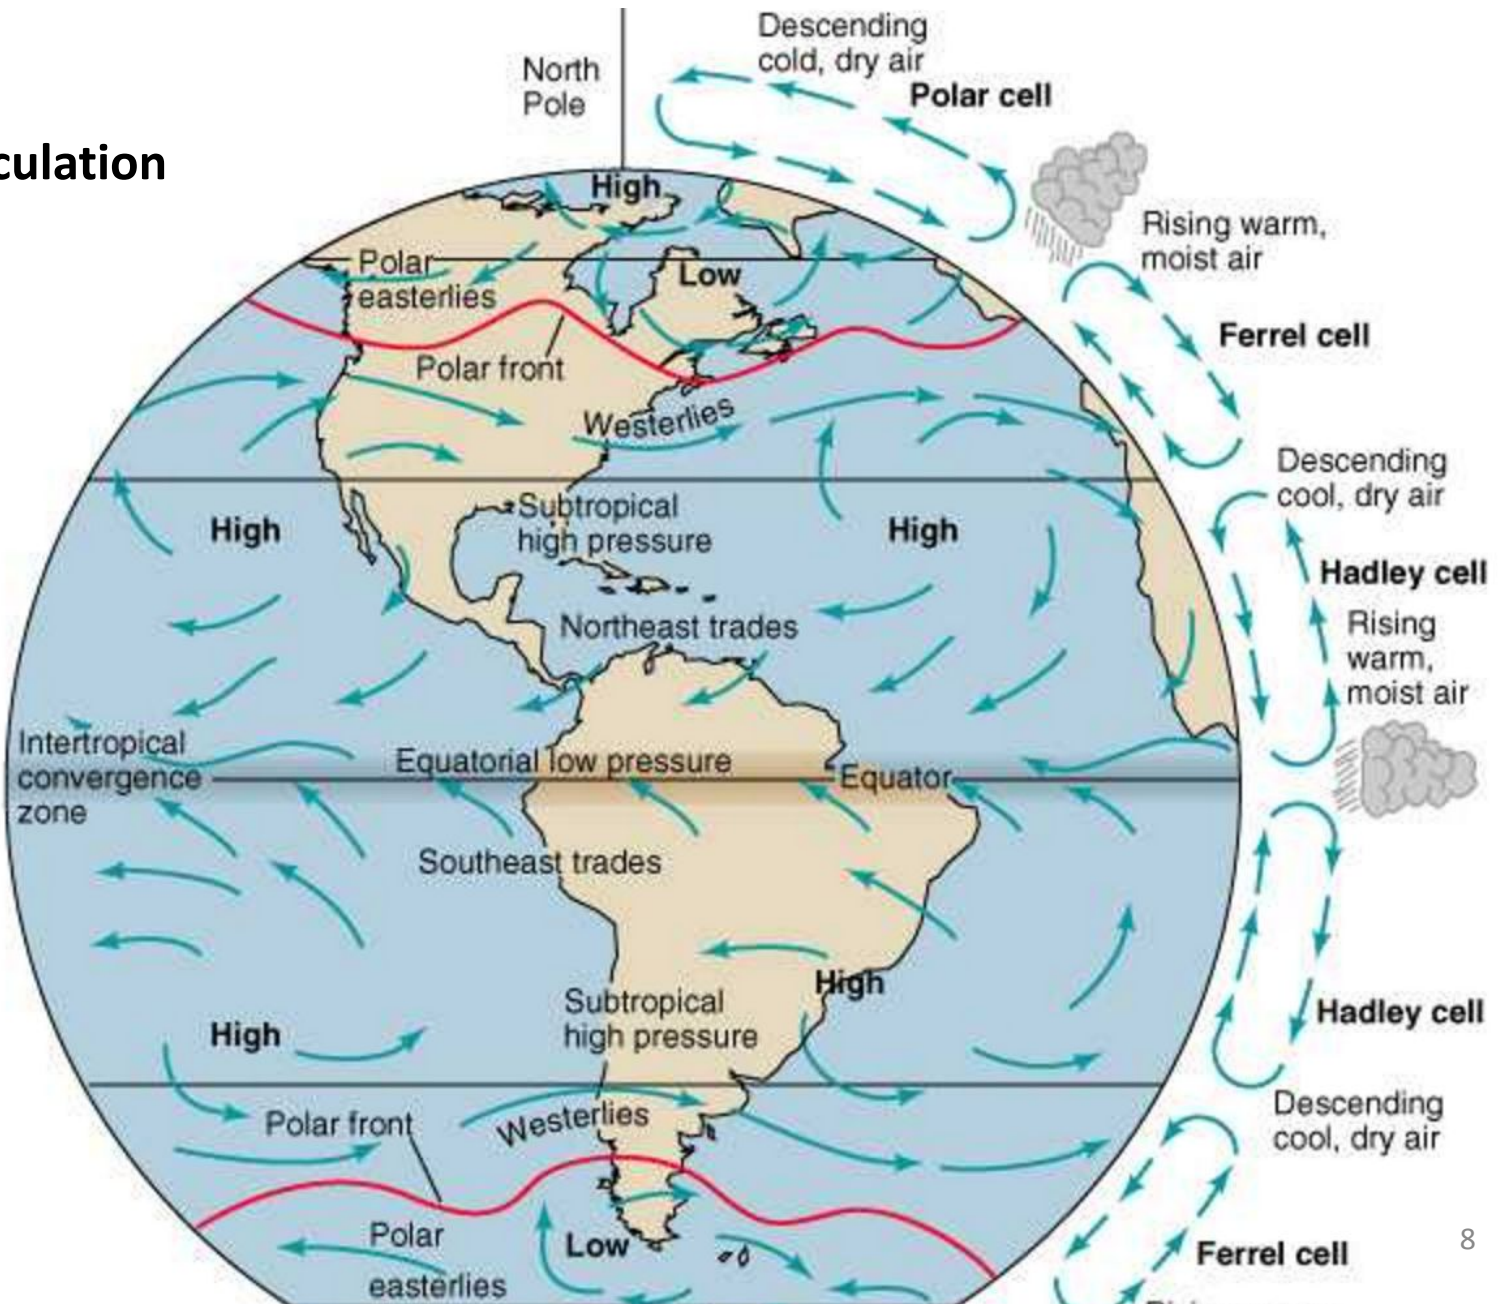

Air masses and their location of origin (Public Domain).

Maritime (m) air masses are moist, continental © air masses dry. Temperature is associated with their latitude (Equatorial, Tropical, Polar, Arctic/Antarctic)

# The Causes of Weather

## Global Circulation

# Fronts and Weather Systems

# Fronts and Weather Systems

## Cloud Types

The basic categorization: shape and height

- Cumulus clouds are puffy and vertical
- Stratus clouds are flat layers
- Cirrus – detached or semi-detached filaments

with precipitation

# Fronts and Weather Systems

## Cloud Types

By Valentin de Bruyn

<https://commons.wikimedia.org/w/index.php?curid=17899555>

# Fronts and Weather Systems

In a **Warm Front** warm air slides over cold air

- Moves slowly 10-15kts
- Weather deteriorates gradually
- Approaching clouds seen from 1000+ miles
- Symbol marking the front is a line with red half circles (warm air is behind the line)

A photograph of a beach scene. The foreground shows a sandy beach. The middle ground features waves with white foam crashing onto the shore. The background is a vast sky filled with numerous wispy, white cirrus clouds. The overall color palette is dominated by blues, whites, and tans.

# Jet Stream Cirrus

# Altostratus

# Stratus

An aerial photograph of a coastline. The land on the left is covered in dense green forest. A sandy beach curves along the shore, meeting the ocean. The ocean is dark blue with white waves breaking near the shore. The sky is filled with thick, low-hanging, greyish-white clouds that appear to be stratus wisps, partially obscuring the view of the sea and sky. The overall atmosphere is misty and dramatic.

**Low-hanging stratus wisps**

# Fronts and Weather Systems

In a **Cold Front** the Cold Air pushes underneath warm air and causes the air to rise violently and rapidly

- Cold fronts move fast 20- 35 kts
- Generally move E-SE
- Weather deteriorates rapidly
- Approaching clouds seen 50- 150 miles ahead of cold front

A photograph of a beach scene. The foreground shows a sandy beach. The middle ground features waves with white foam crashing onto the shore. The background is a vast sky filled with numerous wispy, white cirrus clouds. The overall color palette is dominated by blues, whites, and tans.

# Jet Stream Cirrus

# AltoCumulus

# Cumulonimbus

# Derecho

# Cumulus of Fair Weather

# Cumulus Congestus

# The Boundary Layer: Effects of Land Morning to Afternoon

- Land heats up, air rises, cools, sinks again, wind picks up
- Warm air rises over land, cool air from the sea moves inland (sea breeze)

# The Boundary Layer: The Effects of Land Evening to Night

- Land cools, convection stops, winds die down
- Warm air rises from the water, cool air flows down coastal slopes (land breeze)

Questions?

# Ben Nevis Inn

- Fronts and air masses
- Cloud types
- Wind, waves, and warnings
- What can you tell from looking at the skies and barometer?
- Wave heights (wind and fetches)

## • Forecasting products

- The wide range and uses of forecasting products
- Gribs (General Regularly-distributed Information in Binary form)

## • Planning a Daysail

- A few days out - Windy, PredictWind, etc.
- A few hours out - your local weather radar, forecast and lightning
- During the sail: lightning and eyes

## • Planning a Passage (e.g. Bermuda)

- Intro to OpenCPN
- Loading and updating charts
- Requesting and importing Gribs
- Using the routing plugin with weather and current forecasts

# NOAA Web Site

The screenshot shows the NOAA website interface. At the top, the browser address bar displays "https://www.weather.gov" with a 133% zoom level. The NOAA logo and "NATIONAL WEATHER SERVICE" are prominently displayed, along with the text "NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION". A navigation menu includes links for HOME, FORECAST, PAST WEATHER, SAFETY, INFORMATION, EDUCATION, NEWS, SEARCH, and ABOUT.

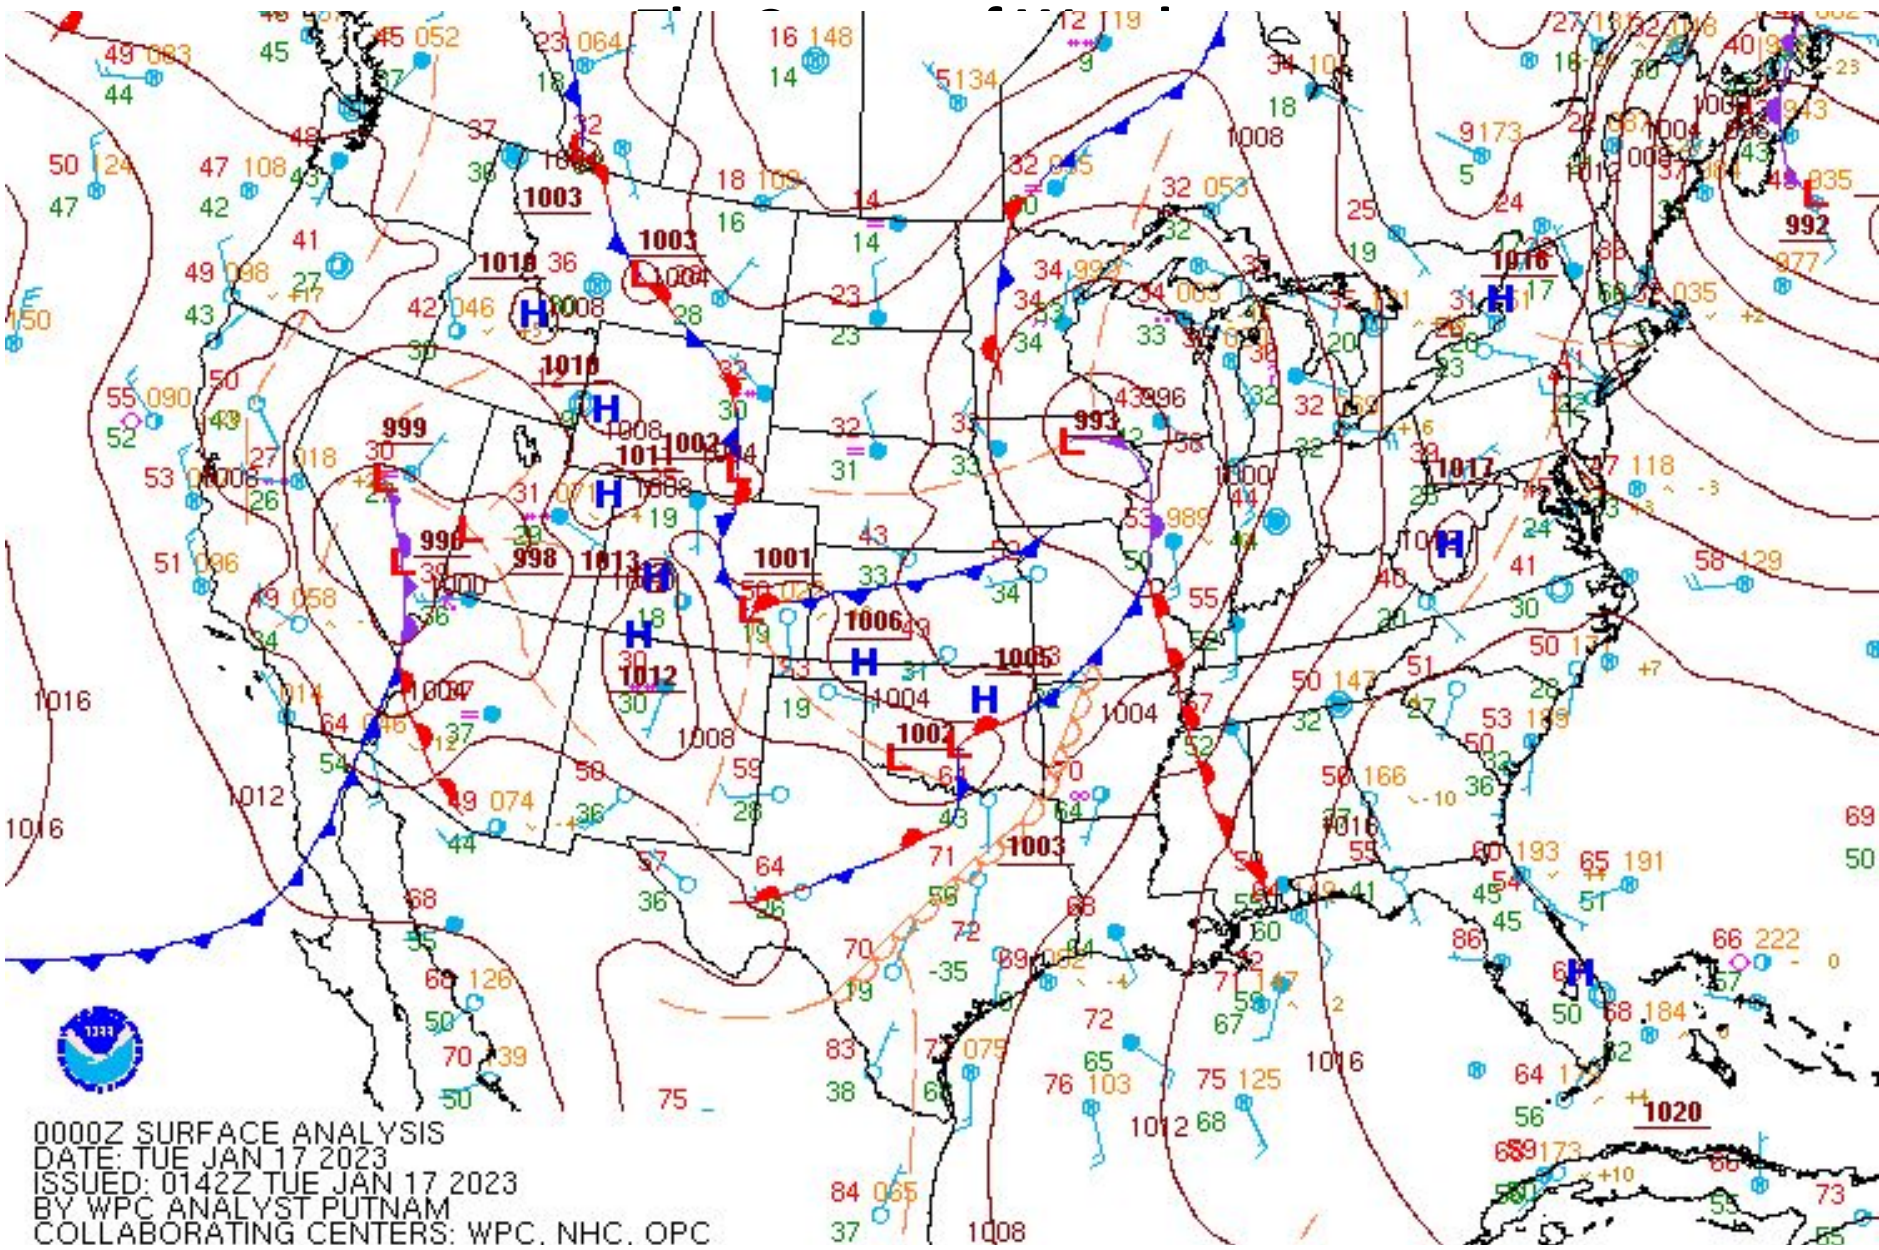

The main content area features a "Local forecast by 'City, St' or ZIP code" section with an input field for "Enter location ..." and a "Go" button. A "Location Help" link is provided below. The primary forecast headline is "Snow for Eastern Great Lakes and Central Appalachians into Mid-Atlantic; Slow Improvement in Southern California". The accompanying text states: "Snow showers, a few squalls, from the Great Lakes region into the central Appalachians and mid-Atlantic through today; Travel conditions may be affected. For southern California, slowly improving conditions as winds diminish later today. Friday and into the holiday weekend, an arctic surge will dive southward with snow showers and squalls for the front range of the Rockies as colder air moves east [Read More >](#)".

Below the forecast, a secondary navigation menu includes "ACTIVE ALERTS", "FORECAST MAPS", "RADAR", "RIVERS, LAKES, RAINFALL", "AIR QUALITY", "SATELLITE", and "PAST WEATHER". A "WRN" logo is visible on the left side.

On the far left, a green sidebar titled "Customize Your Weather.gov" contains a "City, ST" input field, a "Get Weather" button, and a "Remember Me" checkbox. A "Privacy Policy" link is located at the bottom of the sidebar.

The main content area also features a weather map of the United States, titled "Created: 01/16/25 at 17:04 UTC". The map shows various weather patterns, including snow showers and squalls in the Great Lakes and mid-Atlantic regions, and slowly improving conditions in southern California. The map is overlaid with a grid and color-coded areas representing different weather conditions.

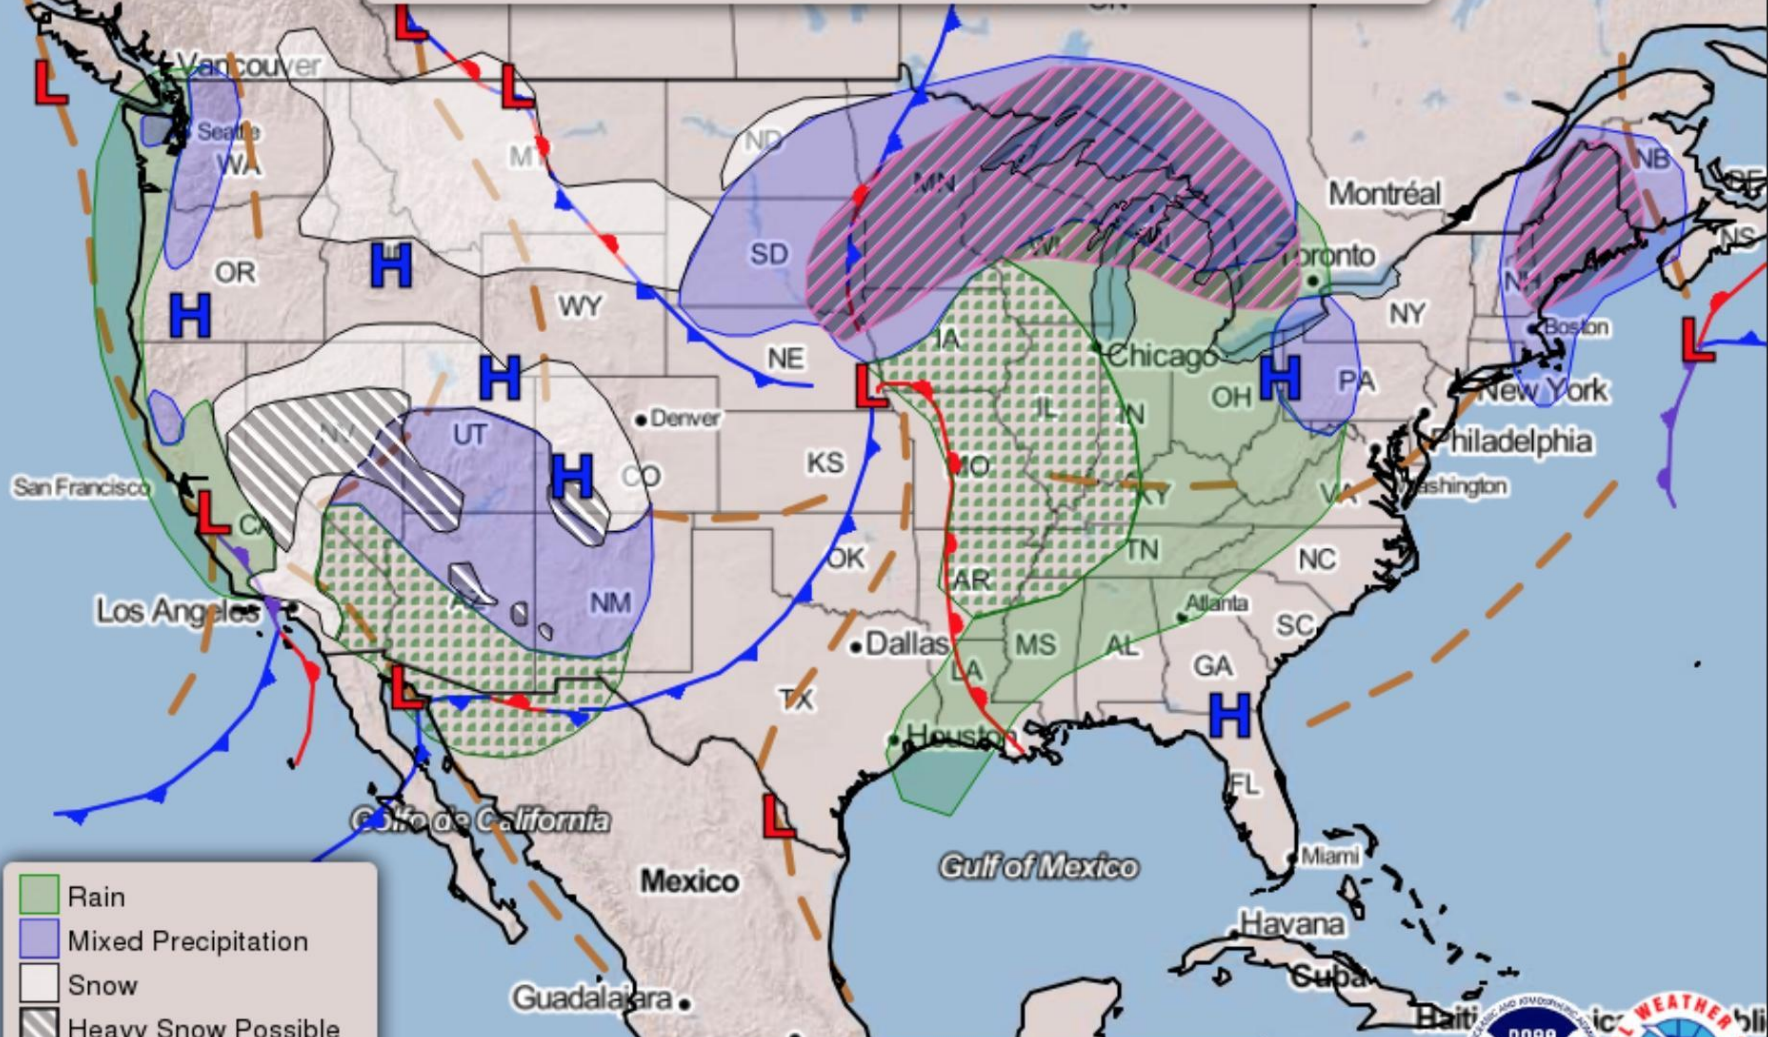

0000Z SURFACE ANALYSIS

# Sources of Weather Forecasts

- National Weather Service Marine Forecast
  - [www.weather.gov/marine](http://www.weather.gov/marine)
  - Also available for mobile devices [mobile.weather.gov](http://mobile.weather.gov)
  - A long list of government sources for weather
- NOAA Weather Radio
  - WX on your VHF radio
- Commercial Products (based on NOAA and other models)
  - Available over your hotspot or StarLink
  - Examples: SailFlow, Windy, Predict Wind, mobileGrib

# Weather Predictions

- Models
  - GFS
  - ECMWF
  - HRR
  - outputs of models are gridded, and have temporal and spatial resolutions.
- Are models in disagreement or changing over time?
  - Not unusual for models to significantly disagree 2.5+ days out
  - Usually there is convergence 24 hours out

# Weather Predictions

- NOAA
  - Marine forecasts
  - Near-term forecasts and analyses
  - Longer-term outlook
  - Includes marine forecasts
  - Also: currents
- Use e.g. Windy to look at NOAA and other models
  - Not unusual for models to significantly disagree 2.5+ days out
  - Usually there is convergence 24 hours out

# Questions?

# An alternate weather forecast...

# Agenda

## • Weather Basics

- Where does the weather come from?
- Fronts and air masses
- Cloud types
- Wind, waves, and warnings
- What can you tell from looking at the skies and barometer?
- Wave heights (wind and fetches)

## • Forecasting products

- The wide range and uses of forecasting products
- Grib (General Regularly-distributed Information in Binary form)

## • Planning a Daysail

- A few days out - Windy, PredictWind, etc.
- A few hours out - your local weather radar, forecast and lightning
- During the sail: lightning and eyes

## • Planning a Passage (e.g. Bermuda)

- Intro to OpenCPN
- Loading and updating charts
- Requesting and importing Grib
- Using the routing plugin with weather and current forecasts

# Day sailing - off your mooring and back

- A few days out
  - Use Windy to look at the models to see if it might be a nice day
  - Read the extended forecast discussion at NOAA
  - Realize that if it's more than 4 days out the forecasts will be wrong.

# Day sailing - off your mooring and back

- A few hours before:
  - Look at the local radar and forecast on your local TV station
  - Look at e.g Windy
  - Keep an eye on the lightning app

# Day sailing - off your mooring and back

- During the sail:
  - Keep an eye out
  - Look at the weather radar on your phone
  - Look at the lightning app on your phone

You don't want to be caught out. An afternoon at the Sail Loft beats an afternoon thunderstorm on a boat.

# Agenda

## • Weather Basics

- Where does the weather come from?
- Fronts and air masses
- Cloud types
- Wind, waves, and warnings
- What can you tell from looking at the skies and barometer?
- Wave heights (wind and fetches)

## • Forecasting products

- The wide range and uses of forecasting products
- Grib (General Regularly-distributed Information in Binary form)

## • Planning a Daysail

- A few days out - Windy, PredictWind, etc.
- A few hours out - your local weather radar, forecast and lightning
- During the sail: lightning and eyes

## • Planning a Passage (e.g. Bermuda)

- Intro to OpenCPN
- Loading and updating charts
- Requesting and importing Grib
- Using the routing plugin with weather and current forecasts

# ECDIS

(Electronic Chart Display and Information System) break

# So you want to go to Bermuda?

- Start looking at the weather weeks before
- Pay close attention to the tropical disturbances  
<https://www.nhc.noaa.gov/gtwo.php?basin=atl&fdays=7>
- Low long will it take you to get there?
- Load the grib and use a routing package
- Do load the wave forecasts

# Fair Winds and Following Seas!

Questions?

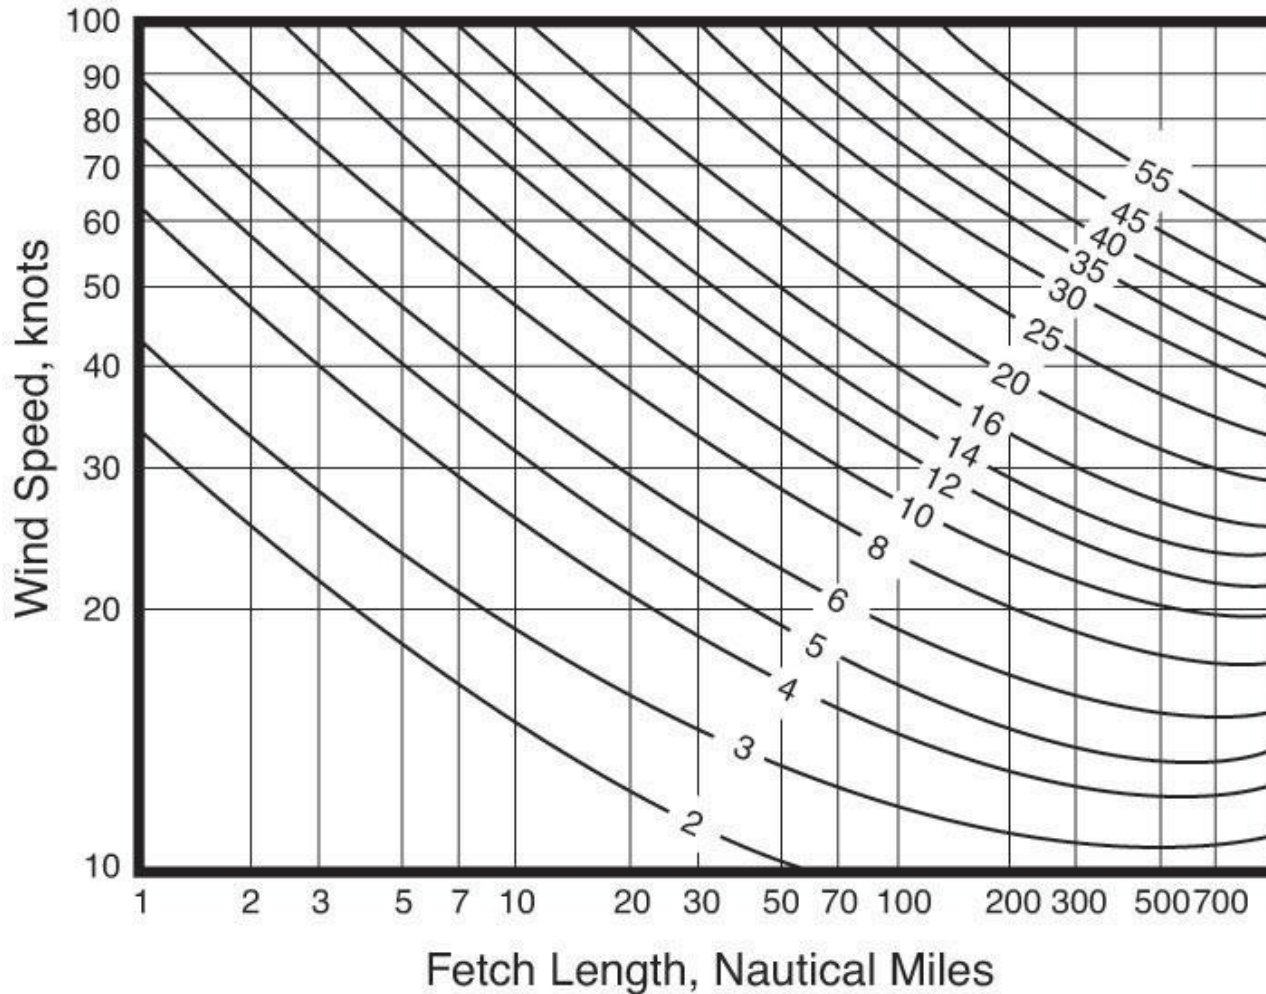

# Falling barometer = a Low is coming

Hurricane Wilma (2005)  
882 mbar at center!

# Winds, Waves and Warnings

The greater the wind and the fetch, the higher the wave:

**Force 0:** Wind Speed less than 1 knot  
**Sea:** Sea like a mirror

**Force 1:** Wind Speed 1-3 knots  
**Sea:** Wave height .1m (.25ft); Ripples with appearance of scales, no foam crests

**Force 2:** Wind Speed 4-6 knots  
**Sea:** Wave height .2-.3m (.5-1 ft); Small wavelets, crests of glassy appearance, not breaking

**Force 3:** Wind Speed 7-10 knots  
**Sea:** Wave height .6-1m (2-3 ft); Large-wavelets, crests begin to break, scattered whitecaps

**Force 4:** Wind Speed 11-16 knots  
**Sea:** Wave height 1-1.5m (3.5-5 ft); Small waves becoming longer, numerous whitecaps

**Force 5:** Wind Speed 17-21 knots  
**Sea:** Wave height 2-2.5m (6-8 ft); Moderate waves, taking longer form, many whitecaps, some spray

**Force 6:** Wind Speed 22-27 knots  
**Sea:** Wave height 3-4m (9.5-13 ft); Larger waves forming, whitecaps everywhere, more spray

**Force 7:** Wind Speed 28-33 knots  
**Sea:** Wave height 4-5.5m (13.5-19 ft); Sea heaps up, white foam from breaking waves begins to be blown in streaks along direction of wind

**Force 8:** Wind Speed 34-40 knots  
**Sea:** Wave height 5.5-7.5m (18-25 ft); Moderately high waves of greater length, edges of crests begin to break into spindrift, foam is blown in well marked streaks

**Force 9:** Wind Speed 41-47 knots  
**Sea:** Wave height 7-10m (23-32 ft); High waves, sea begins to roll, dense streaks of foam along wind direction, spray may reduce visibility

**Force 10:** Wind Speed 48-55 knots (storm)  
**Sea:** Wave height 9-12.5m (29-41 ft); Very high waves with overhanging crests, sea takes white appearance as foam is blown in very dense streaks, rolling is heavy and shocklike, visibility is reduced.

**Force 11:** Wind Speed 56-63 knots  
**Sea:** Wave height 11.5-16m (37-52 ft); Exceptionally high waves, sea covered with white foam patches, visibility still more reduced

# Winds, Waves and Warnings

## Warnings

- Small craft advisory: forecast winds of 25 kts to 33 kts (no guidance on what a 'small craft' is)
- Gale warning: forecast winds of 34 kts to 47 kts
- Storm warning: forecast winds of 48 kts to 63 kts

# Wind and Waves

- Falling barometer
  - Millibars (mb or mbars) typically 1013.25 mbar
  - Falling 4 mb in 3 hours, expect winds 20+ knts
  - Falling 6 mb in 3 hours, expect gale-force winds!

# Wind, Waves and Warnings

Wind comes from differences in pressure, and at the surface flows almost along the pressure isobars (due to the Coriolis force).

Direction and speed is represented on charts via a **wind barb**; the barb 'points' in the direction the wind is going.

# OpenCPN to Bermuda

1/16/24
